In *Contested Rituals*, Robin Judd shows that circumcision and kosher butchering became focal points of political struggle among the German state, its municipal governments, Jews, and Gentiles. In 1843, some German-Jewish fathers refused to circumcise their sons, prompting their Jewish communities to reconsider their standards for membership. Nearly a century later, in 1933, another blood ritual, kosher butchering, served as a political and cultural touchstone when the Nazis built upon a decades-old controversy concerning the practice and prohibited it. In describing these events and related controversies that raged during the intervening years, Judd explores the nature and escalation of the ritual debates as they transcended the boundaries of the local Jewish community to include non-Jews who sought to protect, restrict, or prohibit these rites. Judd argues that the ritual debates grew out of broad shifts in German politics: the competition between local and regional authority following unification, the possibility of government intervention in private affairs, the place of religious difference in the modern age, and the relationship of the German state to its religious and ethnic minorities, including Catholics. Anti-Semitism was only one factor driving the debates and it often functioned in unexpected ways. Judd gives us a new understanding of the formation of German political systems, the importance of religious practices to Jewish political leadership, the interaction of Jews with the German government, and the reaction of Germans of all faiths to political change.

The 2004 World Health Day is dedicated to the theme of road safety by the World Health Organization (WHO) due mostly to the enormous socio economic costs attributed to trafik accidents. More than 140,000 people are injured, 3,000 killed, and 15,000 disabled for life everyday on the world's roads. The field of trauma biomechanics, or injury biomechanics, uses the principles of mechanics to study the response and tolerance level of biological tissues under extreme loading conditions. Through an understanding of mechanical factors that influence the function and structure of human tissues, countermeasures can be developed to alleviate or even eliminate such injuries. This book, *Trauma-Biomechanics*, surveys a wide variety of topics in injury biomechanics including anatomy, injury classification, injury mechanism, and injury criteria. It is the first collection I am aware of that lists regional injury reference values, or injury criterion, either currently in use or proposed by both U. S. and European communities. Although the book is meant to be an introduction for medical doctors and engineers who are beginners in the field of injury biomechanics, sufficient references are provided for those who wish to conduct further research, and even established researchers will find it useful as a reference for finding the biomechanical background of each proposed injury mechanism and injury criterion.

This book presents the state of the art in color science and explains its application to dental structures and materials, using high-quality illustrations to ensure ease of learning. Most people seek a bright smile with a natural appearance. This goal often poses a great clinical challenge for the dentist, and its achievement is dependent on a good knowledge of color science and optical properties relevant to dentistry. Further, if a smile is to be esthetically improved to the patient's satisfaction, the dentist must be able to extract the best from dental materials and techniques, must understand all aspects of facial harmony, and must communicate effectively with both the patient and lab technicians. All of these aspects are thoroughly explored in the book, with detailed coverage of such topics as visual and instrumental shade matching, color management, and avoidance of complications and pitfalls. *Color and Appearance in Dentistry* will be of high value to all who are engaged in the daily practice of esthetic dentistry.

This paper analyzes the extent of income inequality from a global perspective, its drivers, and what

to do about it. The drivers of inequality vary widely amongst countries, with some common drivers being the skill premium associated with technical change and globalization, weakening protection for labor, and lack of financial inclusion in developing countries. We find that increasing the income share of the poor and the middle class actually increases growth while a rising income share of the top 20 percent results in lower growth—that is, when the rich get richer, benefits do not trickle down. This suggests that policies need to be country specific but should focus on raising the income share of the poor, and ensuring there is no hollowing out of the middle class. To tackle inequality, financial inclusion is imperative in emerging and developing countries while in advanced economies, policies should focus on raising human capital and skills and making tax systems more progressive.

Presents a sign-orientated approach to the diagnosis of both common and rare medical disorders that physicians may encounter in hospital or in the community. The comprehensive collection of clinical pictures, organised by anatomical region from scalp to sole, reflects actual clinical practice where a diagnosis has to be constructed from a single sign or a collection of signs. Fundamental, pathognomonic, and commonly seen non-specific clinical signs are presented with clinical features highlighted for rapid recognition and interpretation. In addition, the book provides guidance on appropriate bedside clinical tests for establishing diagnoses.

This fully updated volume utilizes the expertise of scientists currently engaged in immunotoxicity testing to provide the reader with lab-ready procedures and the background information needed to identify effective testing approaches. Dedicated to identifying and describing exogenous agents that can modify immune function, uncovering modes and mechanisms of action for such agents, and translating data from the laboratory and from the clinic to better predict health risks as well as benefits to those who are exposed to immunomodulatory agents, immunotoxicity testing continues to be a vital field of study, and this collection highlights both the "tried and true" methods as well as alternative protocols that have been more recently developed. Written in the highly successful *Methods in Molecular Biology* format, chapters include introductions to their respective topics, lists of the necessary materials and reagents, step-by-step, readily reproducible laboratory protocols, and tips on troubleshooting and avoiding known pitfalls. Authoritative and practical, *Immunotoxicity Testing: Methods and Protocols, Second Edition* serves as a valuable contribution to the continued evolution and the application of immunotoxicity testing.

The authors present their experience in more than seven years of dynamic computed tomography in clinical practice. Time density curves and characteristic examples in specific regions of interest

enrich the presentation. Dynamic computed tomography makes an important contribution to the diagnosis and evaluation of a pathologic process: the demonstration of the dynamics of blood flow within the lesion and surrounding normal tissue. Since both the lesion itself and adjacent normal tissue demonstrate characteristic findings in each circulatory phase, the study provides a large amount of data on the flow of blood and contrast material which facilitate both recognition and differentiation of a lesion. Late studies following administration of a contrast agent allow an estimate of the passage of the contrast medium to the interstitium, which is of diagnostic importance. Chapters dealing with specific clinical entities also contain useful information on the most appropriate means of contrast agent administration (bolus injection or infusion) as well as a discussion of indications for the procedure. Dynamic computed tomography represents a significant advance over conventional computed tomography in some situations, and this signifies a major contribution to the diagnostic capabilities of the clinical radiologist. The authors are to be commended for the fact that they have clearly defined the limits of dynamic computed tomography. I hope that the first English language edition, following the appearance of the German version in 1983, will be well received.

Beatrice Forbes Manz uses the history of Iran under the Timurid ruler Shahrukh (1409-1447) to analyse the relationship between government and society in the medieval Middle East. She provides a rich portrait of Iranian society over an exceptionally broad spectrum - the dynasty and its servitors, city elite and provincial rulers, and the religious classes, both ulama' and Sufi. The work addresses two issues central to pre-modern Middle Eastern history: how a government without the monopoly of force controlled a heterogeneous society, and how a society with diffuse power structures remained stable over long periods. Written for an audience of students as well as scholars, this book provides a broad analysis of political dynamics in late medieval Iran and challenges much received wisdom about civil and military power, the relationship of government to society, and the interaction of religious figures with the ruling class.
