(FVM) is a method for representing and evaluating partial differential equations in the form of algebraic equations. In the finite volume method, volume integrals in a partial differential equation that contain a divergence term are converted to surface integrals, using the divergence theorem. These terms are then evaluated as fluxes at the surfaces of each finite volume. Finite volume method - Wikipedia The finite volume method derives its name from the fact that in this method the governing PDE is satisfied over finite-sized control volumes, rather than at points.
