Many organizations are now realizing that their competitive edge lies mostly in the brainpower-the intellectual capital-of their employees and management. To stay ahead of the pack, companies must leverage their knowledge, internally and externally. But it is not enough to develop lessons-learned databases. Experts now believe the current savior of organizations is knowledge management-the conceptualization, review, consolidation, and action phases of creating, securing, combining, coordinating, and retrieving knowledge-in short, the process of creating value from an organization's intangible assets. Jay Liebowitz, one of the leading knowledge management and expert systems authorities in the world, brings together over thirty articles contributed by the top researchers and practitioners to produce what seems destined to become the key reference for this emerging field. With it you will find: How to create a knowledge-sharing environment How senior executives can show tangible benefits using methods that value the intellectual capital-especially the "human capital" within the organization How knowledge management is not the same as information management How senior management commitment and involvement are essential to the success of a knowledge management system

Process plants produce products and perform functions through some processes. There are many types of process plants covering a wide spectrum of industries from chemical, oil and gas, pharmaceutical, food, power generation, water and waste water treatment, nuclear, to specialized government plants. From engineering, procurement, construction to operations of process plants, the key elements of lifecycle operations are essentially generation, manipulation, and management of information. In addition to documents that are the traditional way of representing information, the trend now is to emphasis on usage of data, databases, and 3-D models. Efficient plant lifecycle information management has to satisfy three basic requirements of what, when, and how information to be managed. Information integrity that means accuracy and currency is another key element of management consideration. Use of information data warehouse is an effective approach to store and control just one single source of information to be used throughout the plant lifecycle. Plant lifecycle information management is to increase productivity at the project level to reduce capital cost and time to market. At the plant level, the goal is to minimize plant operational expense and to maximize time in market. With proper information and information management, the plant

owner/operator now has the tool to optimize operating parameters so both quality and quantity of the plant products can be improved. This book shows the basic principles and approaches of process plant lifecycle information management and how they can be applied to generate substantial cost and time savings. Thus, the readers with their own knowledge and experience in plant design and operations can adapt and implement them into their specific plant lifecycle applications.
